

TabLog helps office buildings and companies to receive their arriving guests quickly and easily with the requirements of the 21st century and to manage their data in accordance with GDPR regulations.

Learn more about the system: www.tablog.hu

Advantages of TabLog

TabLog can assist in several areas in hotel guest management, increasing efficiency and security, in addition to that, it is easy to interconnect the easy-to-install running-on-tablet registration app with the existing internal system.

COST-EFFICIENT

It can relieve the colleague who manages the arrival administration, automating the data recording and declaration management of the guests thus helping to reduce costs in the field of reception staff.

SECURITY AND DISCRETION

It is suitable for minimizing contact numbers during the time of arrival, which is particularly beneficial in the epidemiological situation and for guests requiring higher discretion.

GUEST EXPERIENCE

The registration and the check-out can be done automatically and smoothly thus avoiding the inconvenience and bad experience caused by waiting.

Process of hotel guest arrival

CONFIRMATION

The hotel creates a confirmation for the guest, which includes not only the booking ID (if it is known) but also the unique code and information necessary for the registration.

PRE-REGISTRATION

Guests will receive a link in the confirmation where they can enter their details and accept the hotel's data management note, policies and other statements (for example specifications issued in connection with Covid-19). The requested data and documents can be modified at any time and displayed in the native language of a given guest.

ARRIVAL

Guest scans its unique code on the TabLog Kiosk and confirms its data, or in default of pre-registration, guest can scan its documents on the spot. TabLog can be connected to the parking system as well, the guests' arrival by car can be therefore managed, too. At the end of the registration process, the receptionist can approve or deny the "entry" in real time. In the case of approval, data will be transferred to the HostWear system. If entry is refused for any reason, the guest will be directed to the reception to solve the problem in person.

CHECKOUT

The guest can manage its check-out with the unique code used during log-in. The receptionist will receive a real-time notification so the departure of the guest can be approved immediately, about which the cleaning staff will be also automatically informed thus facilitating the more effective cleaning process.
